01 Your Career Profile

How to read this report

This is not a test with right or wrong answers. It shows what your answers say about you and what that could mean for your future. Treat it as advice, not a rule: nothing here is set in stone, and no single career or field is the only right choice. One field of study can lead to many different careers.

- **Careers that fit you:** how well each one matches you, what to build, one thing to do now, and how AI may change it.
- **Your plan:** one small step for this week, then a 90-day path.
- **Your profile:** your interests, values, strengths and work style. This is why the careers were chosen.

CAREER TYPE

Artistic

TOP VALUE

Wealth

TOP STRENGTH

Learning

02 Your profile

Your interests

The kinds of work you enjoy most (your RIASEC profile)

In short Your RIASEC profile sits at the meeting point of creativity, people-focus, and structured thinking.

Artistic

90%

With an Artistic score of 90, you may find that you are most engaged when you have room to create, design, or express ideas in your own way.

Social

80%

Your Social score of 80 suggests you may be comfortable working with and for other people – explaining things, getting buy-in, or helping colleagues understand complex topics.

Conventional

80%

A Conventional score of 80 means you may also appreciate structure, clear processes, and accuracy alongside your creative side.

Investigative

70%

Enterprising

50%

Realistic

47%

What matters to you

What you want from work and life

In short Your top three values – Wealth, Impact, and Reputation – together suggest you want a career that pays well, matters to people around you, and builds your standing over time.

Wealth

100%

Wealth is your highest-scoring value at 100, which means financial return will be a real factor in how satisfied you feel in any role.

Impact

80%

Impact, scoring 80, means you want to feel that your work actually makes a difference – not just that you completed tasks.

Reputation

70%

Reputation, at 70, suggests that how others see your professional standing is important to you.

What you are good at

Your natural strengths

In short Your top three strengths – Learning, Communication, and Leadership – form a combination that works well in technology roles that are still evolving fast, because you can pick up new skills, explain them to others, and take some initiative when needed.

Learning

90%

Learning, your highest strength at 90, means you tend to absorb new information relatively quickly and stay motivated to keep building knowledge.

To develop it: It would help to practise learning in public – for example, by writing a short weekly note (even just for yourself) summarising one new concept you studied.

Communication

70%

A Communication score of 70 suggests you can express ideas clearly, which is more valuable in technology roles than many people expect.

To develop it: You could practise this by taking one technical concept you are studying each week and explaining it out loud, as if to someone with no technical background – recording a short voice note to yourself works well for this.

Leadership

70%

Leadership at 70 does not mean you need to manage a team right away – at this stage it more likely shows up as taking initiative, volunteering to coordinate a group task, or being the person who keeps a project moving.

To develop it: It would be worth looking for one small leadership opportunity in your first role – for example, volunteering to present a team update or helping to organise a department task – so you build a track record early.

How you think and act

Your personality, using the Big Five traits

In short Across the five personality areas, your profile shows someone who is outgoing and warm, reasonably organised, and open to new ideas at a moderate level – with emotional stability being the one area that sits lower.

Openness to Experience

Medium

Your openness score of 40 sits in the middle range, which suggests you tend to be practical and grounded rather than always seeking out very abstract or theoretical ideas.

Conscientiousness

Medium

A conscientiousness score of 60 suggests you can organise your work and follow through on tasks, though you may find very repetitive or highly rule-bound work less motivating over time.

Extraversion

High

Your extraversion score of 70 is on the higher side, meaning you likely feel comfortable in conversations, meetings, and situations where you need to present or explain your work.

Agreeableness

High

An agreeableness score of 70 suggests you tend to be cooperative and considerate of others, which makes teamwork and collaborative projects feel natural to you.

Emotional Stability

Low

Your emotional stability score of 20 is the lowest in your profile, which may mean that pressure, uncertainty, or criticism can feel harder to manage at times.

How you like to work

Your pace, setting and how you handle pressure

Work Pace

Steady

Environment

Large org

Sector

Public

Mobility

Open to relocate

Long-term focus

Long-term

Resilience

Needs support

Your long-term focus score of 60 suggests you can keep a goal in mind over time, but may sometimes feel pulled toward more immediate concerns. Your work style scores point clearly toward a large, established organisation – likely in the public sector or a big private company – with a steady, predictable pace rather than a fast-moving startup environment.

03 Careers that fit you

We compared your personality, values and strengths with each career. The percentage shows how close the fit is. Each card also shows how AI may change that career. These are not the only options. Do not judge a career by its title; read what the work involves.

UX Designer

Strong

FIT

Builds on your background

AI impact risk: Medium

Your Artistic score of 90 is the highest in your profile, and UX design sits right at the intersection of creativity and technology – which maps directly onto your Information Systems background.

AI/ML Engineer

Strong

FIT

Builds on your background

AI impact risk: Low

Your Investigative score (70) combined with your Learning strength (90) points to someone who enjoys working through complex technical problems – which is exactly what AI and machine learning engineering demands day to day.

Cybersecurity Consultant

Strong

FIT

Builds on your background

AI impact risk: Medium

Your Information Systems background already covers the networking, systems, and data concepts that sit underneath cybersecurity work, so this is a natural next direction rather than a leap into something unfamiliar.

HOW AI MAY CHANGE YOUR CAREERS

Your background in information systems puts you close to the parts of technology that AI is changing the most. Most of your matched careers involve a mix of creative thinking, working with people, and handling structured information – which means AI will change some of your day-to-day tasks but also gives you real opportunities if you understand how these tools work. The key is building the habits that let you work alongside AI rather than being caught off-guard by it.

Build on what you have

UX Designer

Strong

FIT

Technology

Strong fit

Builds on your background

AI impact risk: Medium

Your Artistic score of 90 is the highest in your profile, and UX design sits right at the intersection of creativity and technology – which maps directly onto your Information Systems background. Your high

Communication score (70) and high Extraversion (70) mean you are naturally comfortable talking to users and presenting design ideas to a team, both of which are core to this work.

Bahrain's FinTech sector has an openly acknowledged skills gap in UX design, and government digital-service projects are growing steadily, so demand for people who can design clear, usable digital products is real and increasing.

GAP TO CLOSE

You likely have a technical foundation but probably have not yet built a portfolio of design work – wireframes, prototypes, and user research case studies – which employers and clients look at before anything else.

WHAT YOU CAN DO NOW

1. **It would help to complete a free beginner course in UX design fundamentals – covering user research, wireframing, and basic prototyping – and then use a free design tool to create your first simple screen or app flow as a portfolio piece.** – Employers in Bahrain hiring UX designers almost always ask to see work samples, so having even one well-explained case study puts you ahead of candidates who only have academic credentials.
2. **Looking for a short internship or junior placement at a Bahrain-based tech company, government digital-services team, or FinTech firm is strongly recommended – even two or three months of real project exposure changes how you are perceived by hiring managers.** – With one to three years of general experience, a structured placement in a design role gives you the specific, labelled UX experience that makes your CV easy for a recruiter to understand at a glance.
3. **A good step around months six to twelve would be to work toward the Google UX Design Certificate, which is a recognised qualification in this field and signals to employers that your skills have been assessed against a clear standard.** – This certificate is well known among technology hiring teams in the region and adds a credible label to the portfolio work you will have built by then.

How AI may change this career

AI impact risk: Medium

TASKS THAT ARE CHANGING

- Generating initial wireframes and layout suggestions
- Writing first-draft UX copy and microcopy (short labels, button text, error messages)
- Running basic usability analysis on existing screens

Global evidence: General industry trends show that AI design tools can now generate wireframes and UI (user interface – the screens and buttons a person sees) variations in seconds, which is shifting the early stages of design work. Research from the design industry broadly suggests that the human tasks of defining the right problem and interpreting user behaviour are becoming more important, not less.

In your market: Based on general trends in Bahrain's technology sector, digital government and fintech projects are growing, which is increasing demand for UX work, though AI tools are also being adopted – this is a general outlook, not verified job-market data.

HUMAN SKILLS THAT STAY VALUABLE

Understanding what real users in a specific context actually need

Facilitating user interviews and translating messy feedback into clear design decisions

Making judgment calls about cultural appropriateness and accessibility

WHAT THIS MEANS FOR YOU

As a recent graduate, it would help you to focus on user research skills – the ability to talk to real people and translate what you hear into design decisions – because AI cannot do that well yet. A good starting point would be practising user interview techniques on any real product you use and documenting your findings.

AI/ML Engineer

Strong

FIT

Technology

Strong fit

Builds on your background

AI impact risk: Low

Your Investigative score (70) combined with your Learning strength (90) points to someone who enjoys working through complex technical problems – which is exactly what AI and machine learning engineering demands day to day. Your Information Systems degree gives you the data, systems, and programming foundations that most people entering this field have to build from scratch.

Bahrain's FinTech and government sectors have publicly named AI and machine learning as priority skill gaps, and local employers are already screening for these skills even when job descriptions do not explicitly say so.

GAP TO CLOSE

The step from Information Systems to AI/ML engineering typically requires deeper knowledge of machine learning methods, hands-on experience with Python libraries used for data modelling, and at least one project that shows you can build and evaluate a model end to end.

WHAT YOU CAN DO NOW

1. **It would help to begin a structured beginner course in machine learning – one that covers core ideas like supervised learning, data preparation, and model evaluation – and to complete at least one small hands-on project as part of it, even if the dataset is a simple public one.** – AI and ML roles in Bahrain are in demand but competitive; a documented project shows you can apply the concepts, not just describe them.
2. **Seeking a short internship or junior data or AI role at a Bahrain-based FinTech company, a government technology department, or a regional technology consultancy would be a valuable step, because working inside a real team on real data problems develops judgment that courses alone cannot give you.** – Bahrain employers in this space have noted that they expect AI literacy in new hires – getting that first role or placement is the fastest way to build a credible track record.
3. **Around month nine to twelve, it would be worth preparing for the TensorFlow Developer Certificate or the AWS Certified Machine Learning – Specialty credential, as either gives you a recognised marker of technical readiness that hiring teams in this region respond to.** –

Professional certifications in AI and ML carry weight with technical hiring managers because they show the skill has been tested, not just self-reported.

How AI may change this career

AI impact risk: Low

TASKS THAT ARE CHANGING

- Writing standard or repetitive sections of code using common patterns
- Generating boilerplate model training scripts (standard code used as a starting template)

Global evidence: Broad industry reporting consistently shows that demand for people who can build, evaluate and maintain AI and machine learning systems is growing, even as AI tools help write parts of the code. The understanding of mathematics, data and model behaviour behind this work is not easily automated.

In your market: Bahrain's financial sector and government digital initiatives are showing early adoption of AI, creating demand for this role – though how fast this translates into jobs is a general outlook, not verified job-market data.

HUMAN SKILLS THAT STAY VALUABLE

Deciding which approach is right for a specific problem

Understanding why a model is giving wrong or biased results and fixing it

Explaining AI system behaviour to non-technical colleagues

WHAT THIS MEANS FOR YOU

Your information systems background gives you a good starting point, but it would help to build specific knowledge in how machine learning models work – understanding the logic behind them, not just using ready-made tools. Taking a beginner-to-intermediate course in machine learning fundamentals would be a reasonable next step while you are still early in your career.

Cybersecurity Consultant

Strong

FIT

Technology

Strong fit

Builds on your background

AI impact risk: Medium

Your Information Systems background already covers the networking, systems, and data concepts that sit underneath cybersecurity work, so this is a natural next direction rather than a leap into something unfamiliar. Your Conventional score (80) shows you are comfortable with structured processes and rules – which matters a lot in cybersecurity, where following clear frameworks and standards is part of the job.

Bahrain's Central Bank and government have made cybersecurity a regulatory requirement for financial and public-sector organisations, which means steady demand for people who can help organisations find and fix security weaknesses.

GAP TO CLOSE

You would need to build specific cybersecurity knowledge – areas like network security, ethical hacking basics, and incident response – and earn at least one recognised security certification before most employers will consider you for a consultant-level role.

WHAT YOU CAN DO NOW

1. **It would help to complete a free beginner cybersecurity course covering fundamental topics – how networks are structured, common types of attacks, and basic defence methods – to confirm your interest and fill early knowledge gaps before moving to paid preparation.** – Cybersecurity is a broad field and knowing early which parts interest you most – for example, testing systems versus writing policy – helps you focus the rest of your preparation.
2. **Working toward the CompTIA Security+ certification is recommended once you have the basics in place, as it is a widely recognised entry-level credential that signals to employers you have a verified baseline of security knowledge.** – In Bahrain's financial and government sectors, where cybersecurity roles are most active, certifications act as a first filter – having one gets your application past the initial review stage.
3. **Looking for a junior IT security role or a short placement within the IT or risk team of a bank, government ministry, or large company in Bahrain would be a practical way to move from study to real experience in the nine-to-twelve month window.** – Consultant-level work typically requires you to have seen real security incidents or audits first; a junior placement gives you that exposure without needing to already be at consultant level.

How AI may change this career

AI impact risk: Medium

TASKS THAT ARE CHANGING

- Running routine vulnerability scans (automated checks that look for known weaknesses in a system)
- Producing standard compliance reports from templates
- Monitoring network logs for known threat patterns

Global evidence: General industry reporting shows that AI is being used on both sides of cybersecurity – helping defenders detect threats faster but also helping attackers find weaknesses. This is increasing the need for human analysts who can interpret AI alerts and make judgment calls, not just read automated reports.

In your market: Bahrain's banking and financial services sector has active cybersecurity regulations, and general trends suggest demand for consultants who understand both the technical and regulatory side is steady – this is a general outlook, not verified job-market data.

HUMAN SKILLS THAT STAY VALUABLE

Advising organisations on their specific risk situation

Responding to new or unusual attacks that do not match known patterns

Building trust with clients and communicating risk in plain language

WHAT THIS MEANS FOR YOU

At your stage, it would be worth building toward a recognised entry-level certification such as CompTIA Security+ to establish a solid baseline, while also practising how to explain security risks clearly to a non-technical audience – a skill AI cannot replace and one that is valued highly in consulting work.

Data Scientist**Strong**

FIT

Technology

Strong fit

Builds on your background

AI impact risk: Medium

Your Learning strength (90) and Investigative score (70) suggest you are drawn to problems that require digging into information to find patterns – which is the core activity of data science work. Your Information Systems degree gives you a real head start because you have already studied databases, data structures, and systems thinking, all of which data scientists use regularly.

Bahrain's financial services, FinTech, and government sectors are actively looking for people who can make sense of data, and local employers have noted this as one of their clearest skill gaps right now.

GAP TO CLOSE

Moving from Information Systems to data science typically requires stronger skills in statistics, data visualisation, and Python or R programming, plus practical experience working with messy, real-world datasets rather than clean academic ones.

WHAT YOU CAN DO NOW

It would help to start a free beginner course in data analysis using Python this month and to work through one small real dataset – for example, publicly available Bahrain economic or transport data – as a first practice project.

How AI may change this career

AI impact risk: Medium

TASKS THAT ARE CHANGING

- Writing standard data cleaning and preparation code
- Producing basic charts and summary statistics from a dataset
- Drafting routine data reports

Global evidence: Across the industry broadly, AI tools are automating the more mechanical parts of data work – cleaning data, running standard analyses – which is shifting the value of data scientists toward interpretation, storytelling with data, and framing the right business questions.

In your market: Bahrain's financial and government sectors are generating more data and investing in analytics, suggesting gradual growth in this area – this is a general outlook, not verified job-market data.

HUMAN SKILLS THAT STAY VALUABLE

Deciding which question is worth asking in the first place

Judging whether a result makes real-world sense or is a statistical error

Communicating findings to decision-makers in a way that leads to action

WHAT THIS MEANS FOR YOU

Given your information systems background, you already have some relevant technical knowledge. It would help you to practise presenting data findings to a non-technical audience – try taking a public dataset, finding one clear insight, and explaining it in one page without using technical language. That kind of communication skill is where a lot of the long-term value sits.

Mobile App Developer

Good
FIT

Technology

Strong fit

Builds on your background

AI impact risk: Medium

Your Artistic score (90) combined with your Information Systems background makes mobile app development a good fit because building apps that people actually enjoy using requires both technical skill and a strong sense of how things should look and feel. Your high Learning score (90) means you are likely to pick up new programming frameworks quickly, which matters in mobile development where the tools change often.

Bahrain's e-government and FinTech initiatives are driving real demand for well-built mobile applications, and smaller companies often hire developers who can handle both the technical and design sides of an app.

GAP TO CLOSE

Unless you have already built apps during your studies, you will need to develop practical experience with a mobile development framework – such as Flutter or React Native – and produce at least two or three finished apps that people can actually download or test.

WHAT YOU CAN DO NOW

A useful starting point this month would be to follow a free beginner tutorial in one mobile development framework, aiming to finish a simple working app – even something basic like a to-do list – by the end of the month.

How AI may change this career

AI impact risk: Medium

TASKS THAT ARE CHANGING

- Writing standard or repetitive code blocks
- Generating basic app layouts from a description
- Debugging common and well-known types of errors

Global evidence: General trends in the software industry show that AI coding assistants are now widely used and can write significant portions of standard code, which is changing what junior developers

spend their time on. The roles that remain strongly human involve system design decisions and understanding user needs.

In your market: Bahrain has a growing fintech and e-government app space based on general observation, suggesting ongoing need for mobile development work – this is a general outlook, not verified job-market data.

HUMAN SKILLS THAT STAY VALUABLE

Understanding what users actually need the app to do

Making decisions about app architecture (how the different parts of an app are organised and connected)

Testing edge cases – unusual situations that automated tools tend to miss

WHAT THIS MEANS FOR YOU

As a recent graduate, it would be worth spending time understanding how app architecture decisions are made, not just how to write code. Building a small personal project – even a simple app – and documenting the design decisions you made along the way gives you something concrete to discuss in interviews.

Tech Entrepreneur

Good

FIT

Technology

Worth exploring

Builds on your background

AI impact risk: Low

Your Portfolio Interest score of 100 and your prior entrepreneurship experience (60) show a genuine pull toward building things and owning outcomes, which is the foundation of any entrepreneurial path. Your Artistic score (90) and Communication score (70) are real advantages when it comes to shaping a product idea and talking about it clearly to potential partners or early customers.

Bahrain has a supportive environment for technology-based businesses, with Tamkeen offering funding and support programmes specifically for Bahraini entrepreneurs, and the FinTech space in particular is actively welcoming new entrants.

GAP TO CLOSE

Your Risk Tolerance score came in at 0, which is worth being honest about – building a business involves real financial uncertainty, and it would help to spend time understanding how Bahrain's support programmes can reduce some of that risk before committing fully.

WHAT YOU CAN DO NOW

It would help to attend one of Tamkeen's information sessions or entrepreneur events in Bahrain this month to understand what funding and support is actually available to you at your stage.

How AI may change this career

AI impact risk: Low

TASKS THAT ARE CHANGING

- Writing first drafts of business plans or pitch documents

- Doing initial market research using publicly available information
- Producing basic marketing or website copy

Global evidence: General reporting on entrepreneurship and AI suggests that AI tools lower the cost of starting certain kinds of technology businesses, which can mean more competition but also lower barriers to entry for new founders who know how to use these tools well.

In your market: Bahrain has a government-supported startup environment including dedicated support organisations for new businesses, which based on general trends is making it somewhat more accessible for local founders – this is a general outlook, not verified job-market data.

HUMAN SKILLS THAT STAY VALUABLE

Identifying a real problem worth solving for a specific group of people

Building relationships with early customers, partners and investors

Making decisions under uncertainty with incomplete information

WHAT THIS MEANS FOR YOU

Your combination of information systems knowledge, leadership strength and interest in impact is a reasonable foundation for this path. A sensible starting point would be getting familiar with Bahrain's startup support organisations and attending any local events where founders share their experiences – understanding the real market problems people face locally is where your human judgment matters most.

Paths you may not have considered

Drone Operator

Possible

FIT

Technology

Worth exploring

New direction

AI impact risk: Medium

Your Artistic score (90) and Mobility score (80) suggest you would enjoy work that is hands-on, varied in location, and involves a creative or visual dimension – and professional drone operation, particularly in areas like aerial photography, surveying, or infrastructure inspection, fits that combination. This is not a traditional path for an Information Systems graduate, but your technical background helps with the data processing and systems side of modern drone work.

Demand for drone services in Bahrain is growing in areas like construction site surveying, infrastructure monitoring, and media production, though the field is still relatively small and most operators work on a project or contract basis.

WHAT IT TAKES TO GET THERE

You would need to obtain the relevant civil aviation certification required by Bahrain's Ministry of Transportation to operate drones commercially, and you would benefit from building a portfolio of practical flight and project work before approaching clients.

WHAT YOU CAN DO NOW

A sensible first step would be to research the current civil aviation licensing requirements for commercial drone operators in Bahrain through the Ministry of Transportation, so you understand exactly what is needed before spending any money on equipment or training.

How AI may change this career

AI impact risk: Medium

TASKS THAT ARE CHANGING

- Following pre-programmed flight paths in routine, predictable environments
- Processing and sorting large volumes of aerial footage using automated tools
- Generating standard inspection reports from image data

Global evidence: Based on general industry trends, autonomous drone technology is advancing, automating more of the routine flight and data collection tasks. At the same time, complex environments, regulatory compliance and client-facing work continue to require human judgment.

In your market: Drone use in Bahrain appears to be growing in areas like infrastructure inspection and media production based on general observation, though the regulatory framework affects how and where operators can work – this is a general outlook, not verified job-market data.

HUMAN SKILLS THAT STAY VALUABLE

Making real-time decisions in complex or unexpected situations during a flight

Understanding regulations and operating safely within local rules

Working with clients to understand what they actually need from a drone survey or shoot

WHAT THIS MEANS FOR YOU

If this direction interests you, it would help to start by understanding Bahrain's Civil Aviation Affairs regulations around drone operation, since knowing the rules is one of the skills that stays valuable as the technology changes. Pairing technical operation skills with a specific application area – such as infrastructure or media – would give you a clearer focus.

04 Your plan

One small step for this week, then a simple 90-day path, built around your top career match

Your chosen direction: Artificial Intelligence Your choice

Your strengths in learning, communication, and leadership fit well with AI roles that involve working with teams, explaining technical ideas clearly, and picking up new tools quickly – skills that matter a lot in this field. That said, your top RIASEC types are artistic, social, and conventional, which means you may enjoy creative and people-facing work more than deep solo coding, so a role like AI product analyst or AI project lead may suit you better than a pure machine-learning engineering role.

GAP TO CLOSE

Most AI roles in Bahrain expect you to know programming in Python and to understand basic machine learning concepts – that is, how computers learn patterns from data – which may go beyond what a general information systems degree covers. You will likely need to fill this gap with focused self-study or a short course before you are competitive for technical AI positions.

Based on general market trends in Bahrain, AI-related roles are growing but still relatively limited in number, and most employers at entry level expect candidates to show a portfolio of small projects or certifications alongside their degree – this is a general outlook, not verified job-market data.

Your first step this week

Find 5 real entry-level or junior AI-related job postings on Bahraini job boards such as Bayt or LinkedIn filtered to Bahrain, and write down the exact skills, tools, and qualifications each one asks for.

Why: Seeing real postings tells you what employers in Bahrain actually want right now, which is more useful than guessing. It also helps you compare those requirements against what your information systems degree already gave you, so you know exactly what to focus on.

YOU WILL PRODUCE

A simple two-column list: on one side, what the job asks for; on the other side, which of those things you already have from your degree or work experience. This becomes your personal gap list.

WHEN

Day 1 – set aside about 60 minutes, it is free, and you can do it alone on any device.

Worksheet:

Looking at the 5 postings, which 3 skills or tools appear most often that you do not yet have from your studies?

Which parts of your information systems coursework or past work experience match something at least one employer is asking for?

Based on the job titles you found, which type of AI role seems closest to what you want to do day-to-day – more technical, more analytical, or more project-focused?

Days 2-7

Days 2-3 – It would help to take your two-column gap list and write a one-page summary of your degree, your 1-3 years of experience, and any projects you completed that touch on data, systems, or technology. This becomes the raw material for your CV.

You will produce: A rough one-page professional summary document that you can use as the base for a full CV.

Day 4 – A good use of this day is to draft a proper CV using your summary, making sure the skills and tools you already have are clearly listed and matched to the language you saw in the job postings. Free CV templates are available on most job platforms.

You will produce: A first draft of your CV, tailored toward AI or data-related roles, ready for feedback.

Days 5-6 – We suggest asking one person – a former classmate, a lecturer, or a colleague from your work experience – to read your CV draft and give you honest feedback, then make at least 3 specific improvements based on what they say.

You will produce: A revised CV with at least 3 clear improvements noted, and a short list of the feedback you received.

Day 7 – A good way to end the week is to review what you produced and pick the next step.

You will produce: A short written note – even a few bullet points – summarising what your CV now shows, which gaps still need filling, and one concrete thing you will do in week 2 to move forward.

Your next 90 days

1 Weeks 2-4 – Build momentum

Taking a free beginner course in Python for data analysis – available on several free online learning platforms – would help you start filling the most common technical gap employers ask for, and completing even the first few lessons gives you something concrete to mention on your CV.

It would be worthwhile to set up or update a profile on a professional networking platform, list your information systems background and your interest in AI, and connect with at least 5 people in Bahrain who work in technology or data roles – this is not about asking for a job, just about making your presence visible in the local tech community.

Working through one small, self-directed project – for example, downloading a public dataset and writing a short report on patterns you find – would give you a basic portfolio item to show employers, which matters more than many candidates realise at the entry level.

2 Months 2-3 – Build

Preparing for and sitting a recognised entry-level certification such as the Microsoft Azure AI Fundamentals (AI-900) or the IBM AI Foundations for Everyone certificate would show employers a formal, verifiable signal that you understand core AI concepts, and both are achievable without years of prior AI experience.

It would help to start attending any technology or AI-related meetups, workshops, or events held in Bahrain – government and private sector organisations in the country do run these from time to time – because meeting people working in the field gives you a much clearer picture of what local employers actually look for day-to-day.

A good use of months 2 and 3 is to apply to at least 3 entry-level or junior roles in Bahrain that match your updated CV – even roles with titles like data analyst, systems analyst, or technology associate that sit next to AI work – so you get real feedback from the application process and can adjust your materials accordingly.

Your skills to build and practice exercise: Artificial Intelligence

SKILLS TO BUILD

Evaluating and improving AI outputs – AI tools can produce code, designs, reports and written content quickly, but they often make mistakes or miss context – being able to check, correct and improve what AI produces is what makes your work reliable and trusted.

Prompt writing – giving clear instructions to AI systems – Almost every career on your list now involves asking AI tools to help with something; the quality of what you get back depends almost entirely on how clearly and specifically you ask, so this is a practical skill that transfers across all of these roles.

PRACTICE EXERCISE

A good exercise would be to pick a real task from any of your career interests – for example, writing a short user research summary, a basic security risk list, or a simple app feature description. First, write your own version without any AI help, even if it takes only ten minutes. Then, open a free AI chat tool and give it a prompt asking it to do the same task. Compare the two versions side by side: note where the AI was more complete, where it was wrong or too general, and what you had to fix or add. Then write a short paragraph explaining the three most important decisions you made when editing the AI version.

YOU WILL HAVE

You will have a before-and-after document – your original version, the AI version, and your edited final version – plus a short note explaining your decisions. This is something you can show to a future employer to demonstrate that you can use AI tools critically, not just blindly.

05 Recommended Certifications

Short qualifications employers recognise, chosen to fit your matched careers. These are for later, and certifications change, so check the provider's current list before you enrol.

Google UX Design Certificate

a large technology company's online learning programme

For: UX Designer

What it is about: It covers the full process of designing digital products that are easy and pleasant to use – from early sketches to tested prototypes – and you build a small portfolio of design work as you go.

Why it is suggested: UX design roles usually ask for a portfolio of work, not just a degree, so finishing this programme gives you real design examples to show employers alongside your computer science background.

IBM AI Foundations for Everyone

a professional technology company's online learning division

For: AI/ML Engineer

What it is about: It covers the basic ideas behind artificial intelligence and machine learning – what they are and how they work – and you finish with a certificate from IBM.

Why it is suggested: Because you are just starting out, this gives you a recognised foundation in AI concepts before you move into more technical study, which is useful when applying for entry-level AI or ML roles.

CompTIA Security+

CompTIA, an international professional body for technology workers

For: Cybersecurity Consultant

What it is about: It tests your knowledge of core security ideas – things like protecting networks, managing risks, and responding to threats – and passing gives you a widely recognised security certification.

Why it is suggested: Cybersecurity employers in Bahrain regularly look for this certification as a starting point, and it has no work experience requirement, which makes it a good early step for a recent graduate.

Google Data Analytics Certificate

a large technology company's online learning programme

For: Data Scientist

What it is about: It walks you through how to collect, clean, analyse, and present data using tools like spreadsheets, SQL, and a basic data visualisation tool, and you receive a certificate at the end.

Why it is suggested: Your information systems background already gives you some related knowledge, and this certificate would show hiring managers that you can do practical, hands-on data work from day one.

Meta Android Developer Certificate

a large technology company's online learning programme

For: Mobile App Developer

What it is about: It teaches you how to build Android mobile applications using Kotlin, covering the full cycle from writing code to preparing an app for release, and you receive a certificate upon completion.

Why it is suggested: Mobile app roles often expect you to show working apps, and this programme is designed for people who are new to mobile development, making it a practical way to build skills and projects you can show to Bahraini employers.

06 Recommended Courses

Courses that build the skills your matched careers need. These are for later: use them as a guide when you are ready, not something to do all at once.

UI/UX Design Fundamentals

Google UX Design Certificate (Coursera) · beginner

For: UX Designer (Technology)

What it is about: This course covers the full UX design process, from user research through to building prototypes using Figma.

WHY IT IS SUGGESTED

UX designers use exactly these skills every day, and this course matches your artistic and social personality well since UX work is about understanding people and creating clear, useful designs.

Machine Learning Specialization

Coursera (DeepLearning.AI) · intermediate

For: AI/ML Engineer (Technology)

What it is about: This course covers the foundations of machine learning, including supervised and unsupervised learning, using Python.

WHY IT IS SUGGESTED

Building and training machine learning models is the core daily work of an AI/ML engineer, and your computer science background means you are well placed to follow this material.

Python for Everybody

Coursera (Michigan) · beginner

For: AI/ML Engineer (Technology)

What it is about: This course teaches Python programming from the beginning using real-world projects.

WHY IT IS SUGGESTED

Python is the main language used by AI and machine learning engineers, and having a solid base in it before the machine learning course will make the harder material easier to follow.

Cybersecurity Fundamentals

Coursera (IBM) · beginner

For: Cybersecurity Consultant (Technology)

What it is about: This course introduces practical cybersecurity skills including how to identify threats and respond to security incidents.

WHY IT IS SUGGESTED

Threat analysis and incident response are tasks a cybersecurity consultant handles regularly, so this course builds directly useful knowledge for that role.

Google Data Analytics Certificate

Coursera (Google) · beginner

For: Data Scientist (Technology)

What it is about: This certificate covers data analytics end to end, including SQL, R, and Tableau for finding and presenting insights from data.

WHY IT IS SUGGESTED

Data scientists work with these tools daily to clean, analyse, and communicate data findings, making this a practical and directly relevant starting point.

Your Journey Starts Here

Noor, your combination of creative thinking, strong communication, and a genuine drive to keep learning puts you in a reasonable position to move into the technology sector in Bahrain – the key now is to be specific and consistent in how you prepare. The fact that you are honest about wanting financial return and real impact from your career is not a problem; it actually helps you focus on roles and organisations where those things are genuinely possible, rather than drifting toward options that sound good but do not match what you actually want. Take it one week at a time, use what you know from your information systems degree as your starting point, and build from there.
